

Практическое задание по лекции 11

Прогон программы, иллюстрирующей функционирование кэша

```
#include <windows.h>
#include <stdio.h>
int main(void) {
HANDLE hFile, hHeap;
int iRet = 0;
void *pMem;
long FileSize = 0, FilePos = 0;
DWORD iRead = 0, iWrite = 0;
char * String;
hFile = CreateFile("MYFILE.TXT", GENERIC_READ|
GENERIC_WRITE,0,
NULL, OPEN_EXISTING,FILE_ATTRIBUTE_NORMAL |0, NULL);
if (hFile == INVALID_HANDLE_VALUE) printf("Could not open file\n");
FileSize = GetFileSize(hFile, NULL);
printf("FileSize = %d\n",FileSize);
hHeap = GetProcessHeap();
pMem = HeapAlloc(hHeap, HEAP_ZERO_MEMORY, FileSize + 2);
String = (char *)pMem;
ReadFile(hFile, pMem, FileSize, &iRead, NULL);
printf("Read %d bytes \n", iRead);
for(FilePos = 0; FilePos < FileSize; FilePos++)
String[FilePos] = '1';
SetFilePointer(hFile, 0, NULL, FILE_BEGIN);
getchar();
WriteFile(hFile, pMem, FileSize, &iWrite, NULL);
printf("Write %d bytes \n", iWrite);
iRet = FlushFileBuffers(hFile);
if(iRet == 0) printf("FlushFileBuffer Error\n");
HeapFree(hHeap, 0, pMem);
CloseHandle(hFile);
}
```

Вывод

```
FileSize = 59
Read 59 bytes

write 59 bytes
```

Поведение счетчика при запуске программы
